API Updates

Do you have API's that create/upload any documents to Vault?

If the answer is YES, then Customers can do any of the following 3 options:

	Action	Result	Comment
1	Do nothing	Any documents created or uploaded into Vault through APIs will be given these default values: • Global Content Type = Not Specified • Content Creation Currency = Not Specified • Content Creation Cost = Not Specified	To ensure you get a rich data set for these documents, users should add the standard metrics values after the documents have been created/uploaded through the API into Vault.
2	Map Global Content Type & Content Creation Currency in vault	Any documents created or uploaded into Vault through APIs will be given these default values: • Global Content Type = mapped value • Content Creation Currency = mapped value • Content Creation Cost = Not Specified If no mapped value available, then it will default to 'Not Specified'	Of the 3 options this is recommended as: - it requires no API update effort. - it will save users time adding the values manually - It will lead to a richer Standard Metrics data set. Once the documents are in Vault users may want to go in and update the cost field so that you gather a richer data set for the cost field.
3	Update your API to provide values for Global Content Type, Content Creation Cost and Content Creation Currency	Any documents created or uploaded into Vault through APIs will be given these default values: • Global Content Type = API value provided • Content Creation Currency = API value provided • Content Creation Cost = API value provided If no mapped value available, then it will default to 'Not Specified'. Note you must provide both Currency and Cost values in the API to be able to update the Cost field.	This is useful to ensure documents added through the API have a Content Creation Cost value added to them to save users time adding it after the documents are created/uploaded through the API into Vault.

To update the API

- Note: update API version v19.1 and after. (Earlier versions of API will default to 'Not Specified' even if Standard Metric values are added to the API.)
- Note: Must provide both Currency and Cost values in the API to be able to update the Cost field. If you only provide Cost values in the API (not currency) then the API will fail.
- Add the following 3 keys to the API:

Key	Value
global_content_type__v	Use the Picklist Value Label: • Component • Corporate Communication • Electronic Sales Aid • Email • Event Material • Health Authority Form / Compliance Package • Mobile App • Paid Search • Print / Physical Resource • Reference Materials • Social • Training Materials • Video • Web Banners • Website • Other
content_creation_cost__v	Use the Object Record ID
content_creation_currency__v	Use the Object Record ID
